

INDEX OF INDUSTRIAL PRODUCTION

Deceleration in the decline of industrial production growth trends in the Community

On the basis of returns from six countries (D,F,I,UK,L,DK) whose industrial production comprises 90% of that in the European Community, the unadjusted all industries index is estimated by EUROSTAT to have attained the level of 125.1 (1975=100) in November 1980, a drop of 2.8% over the corresponding month of the previous year. This follows yearly percentage changes in the index of -4.1%, -5.3% and -3.9% in August, September and October calculated on the same basis, and provides a pointer that the fourth quarter of 1980 may mark the beginning of the bottoming out of the cyclical downturn in industrial production. The same inference can be drawn from the provisional seasonally adjusted data showing that the all industries' index rose to 116.0 (1975=100) in November 1980, a monthly increase of 1.5%, following changes of -0.9% and 0.8% in September and October respectively. Short-term industrial production growth trends, identified by the percentage changes in three month moving averages of the seasonally adjusted industrial production indices, remain negative but as suggested by the developments outlined above the result for the month of November was a noticeable improvement on some earlier rates (see table 2). Interestingly, the deceleration in the decline of short-term growth has brought to an end a period of nearly a year during which rates have deteriorated every month. This tends to support the hypothesis advanced above that the low point of the current recession may be reached soon.

Examining total industry growth trends in terms of developments in the major product regroupments reveals that the steady decline in short-term rates was arrested most sharply in November in the intermediate goods sector (-3.9% to -1.7%), followed by the investment goods sector (-2.0% to -0.8%) and the consumer goods sector (-2.8% to -2.3%). Both in terms of the size of the improvement and the influence on the all industries index, the deceleration in the decline of the growth rate in the intermediate goods sector is most significant.

Turning to trends at the member state level the latest data show a deceleration in the decline of short-term industrial production growth in Germany, Belgium, Netherlands, Luxembourg and Denmark, with a large turnaround from negative to positive growth being registered in Italy. However, in France and the United Kingdom, short-term growth rates continued to fall, with UK rates in particular remaining sharply negative. Significant variations in long term growth rates by member state are also noticeable (see accompanying graphs) with rates dropping away at differing speeds. The net effect on the Community index is that little or no growth in industrial production is likely to have taken place during 1980.
